Threat Intelligence Aggregator

Requirements & Installation Sheet

Project purpose: Collect and normalize Indicators of Compromise (IoCs) from AlienVault OTX and optionally VirusTotal Intelligence Search, then export JSON and CSV.

1. Software requirements

- Python 3.10 or newer
- requests >= 2.31.0 and < 3.0.0
- Internet connection
- pip / Python package installer

2. API access

- **AlienVault OTX:** OTX_API_KEY for subscribed-pulse collection.
- **VirusTotal:** VT_API_KEY. The Intelligence Search endpoint may require an eligible account plan; a standard API key may not grant access.

3. Install

```
python -m venv .venv
# Activate the environment for your OS
python -m pip install -r requirements.txt
```

4. Configure credentials

```
Windows PowerShell:
$env:OTX_API_KEY="your_otx_api_key"
$env:VT_API_KEY="your_virustotal_api_key"

macOS/Linux:
export OTX_API_KEY="your_otx_api_key"
export VT_API_KEY="your_virustotal_api_key"
```

5. Run

```
python threat_intelligence_aggregator.py --limit 10
python threat_intelligence_aggregator.py --skip-vt
python threat_intelligence_aggregator.py --skip-otx --vt-query "type:ip"
```

6. Outputs

The program creates output/indicators.json and output/indicators.csv. Missing credentials, unsupported permissions, rate limits, and network errors are reported as warnings.

Security reminder: never commit API keys to GitHub. Use indicators only for authorized defensive security analysis and follow provider terms and quotas.
